April 2, 2003

I'd like to take a moment of your time to tell you how I can benefit you in your practice. My name is David E. Rogers, D.D.S. and I am a Dentist Anesthesiologist. A dentist anesthesiologist is a dentist who is trained extensively in the specialized field of anesthesia. Training consists of a two-year general anesthesia residency that involves care provided in a hospital operating room, outpatient surgery center and private practice environment. Clinical training includes rotations in emergency medicine, internal medicine, cardiology, acute and chronic pain management, and many other fields.

Your practice can benefit from the use of a dentist anesthesiologist by assisting you in your dental office with children (who may be uncooperative making treatment difficult), physically or medically compromised patients (such as those with high blood pressure, heart disease, asthma, TMJ, downs syndrome, cerebral palsy, seizure disorders, or mental retardation), patients with gagging problems, patients with a history of problems with local anesthetics, patients with time constraints (multiple procedures can be completed in less time when patients are sedated or under general anesthesia), and patients with low pain thresholds. Often extensive treatment plans can be completed in one visit.

Anesthesia can be performed in your own dental office easily and safely. The dentist anesthesiologist comes to your office equipped with an advanced computer controlled monitor, pulse oximeter, precordial stethoscope, electro-cardiograph, blood pressure monitor, oxygen, all necessary medications and even a portable defibrillator (for cardiac emergencies). The dentist anesthesiologist uses anesthetics, which are administered intravenously and can be titrated for different levels of general anesthesia/sedation. Patients are continuously monitored during dental procedures and recovery by the dentist anesthesiologist.

If you would like to learn more about how Anesthesia for Dentistry can benefit your practice or if you have any questions about this service, please give me a call at (909) 499-2172.

Sincerely,

David E. Rogers, D.D.S.
